

## **INN Hotels Project**

Supervised Learning - Classifications

July 6, 2023

### **Contents / Agenda**

- Executive Summary
- Business Problem Overview and Solution Approach
- EDA Results
- Data Preprocessing
- Model Performance Summary
- Appendix

### **Executive Summary**

- Summary of observations and conclusions
  - Log regression with 0.42 threshold is giving the best value (Accuracy: 80.51%, Recall: 69.96%, Precision: 69.86% and F1 score: 69.91%) compared with default threshold and 0.37 threshold. It also giving a comparable data between both training and test performance.
  - Log regression with 0.42 threshold also giving the balanced Precision-Recall Curve.
  - Post-pruning decision tree is the giving the best value (Accuracy: 88.28%, Recall: 79.05%, Precision: 83.81% and F1 score: 81.36%) compared with the pre-pruning value. It also giving the best F1 value compared with pre-pruning. Both data on training and test performance is comparable, an indication of model is not overfitting.

### **Business Problem Overview and Solution Approach**

- Business problem overview:
  - Top 4 importance features were identified through decisions tree; which is lead\_time, avg\_price\_per\_room, market\_segment\_type\_online and no\_of\_special\_request. The company should look into these 4 top reasons to improve their business.
  - Price of room is very competitive during peak season
  - The highest customer who book the hotel is 2 adult and a couple with no children.
  - The breakfast meal plan becomes the highly sought after on the package of hotel booking.
  - Summer and end year holiday is the peak season, business owner should improve/comes out a
    plan to cater the customer booking hotel requirements.

### **Business Problem Overview and Solution Approach**

- Solution approach/business improvement/recommendation
  - Suggested business owners to create a loyalty program for repeated customer.
  - During online booking process, the website/business owner should offering additional customizations/special request for customer, to prevent the likelihood of booking being cancelled.
  - Since most customer did not require car parking space, business owners should utilize the space to create hotel event/special activities to attract more customers.
  - Business owners may need to give vouchers/promotion/discount for meal plan 2 and 3 to attract customer to have a lunch and dinner at the hotel. Also, business owners may need to vary the lunch and dinner recipe for additional attraction. Food festival/food event also would help to increase the sales and hotel rating review.

- No\_of\_adults are vary from one person to maximum 4 person, while no\_of\_children from none to maximum 10 person.
- Arrival\_year can be seen from January until December with the average month is at July
- Avg\_price\_per\_room is ranging between zero to 540 euro with average around 103.4 euro

### **EDA Results – Univariate Analysis: 1. Lead Time**

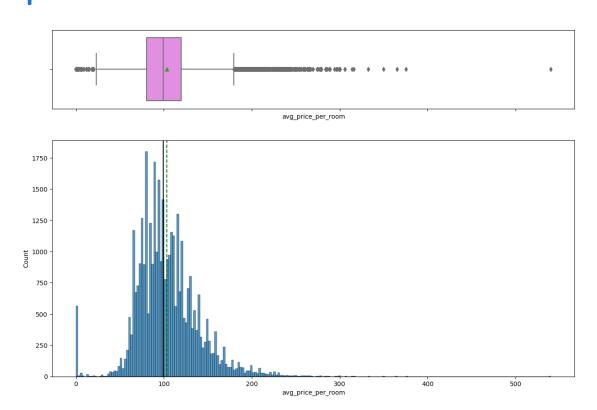

- Number of lead\_time can be seen skewed to the right with some outlier.
- Mostly guests will book their hotel at last minute until 85 days.
- However, some can be seen to book early as long as long 300-400 days

# EDA Results – Univariate Analysis: 2. Average Price per Room

 Avg\_price\_per\_room can be seen quite competitive with average around 100 euros, and outlier can be seen at both sides

# EDA Results – Univariate Analysis: 2. Average Price per Room

 Avg\_price\_per\_room can be seen from sides, which is from online and complementary

Complementary 354 Online 191

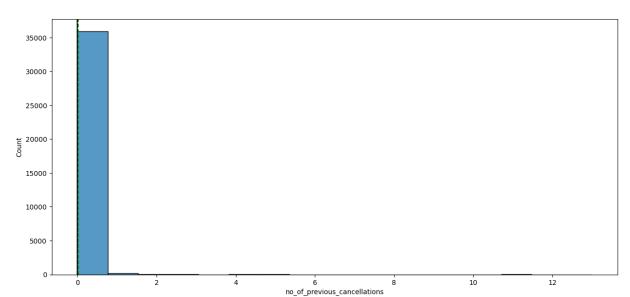

Name: market\_segment\_type, dtype: int64

# EDA Results – Univariate Analysis: 3. Number of Previous Gooking Cancellations

 It can be seen most customer did not cancelled their bookings.

# EDA Results – Univariate Analysis: 4. Number of previous booking not cancelled

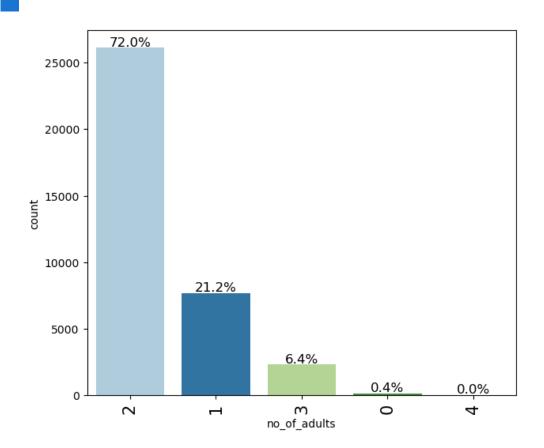

- This result is supported with the same finding on previous slide (slide#11).
- Most customer did not cancelled their bookings.

### **EDA Results – Univariate Analysis: 5. Number of adults**

 Maximum number of adults to book a room is two person, followed by one person.

### **EDA Results – Univariate Analysis: 6. Number of children**

 A couple with no children becomes a top detractor, which is around 92.6%, followed by a couple with 1 child, around 4.5% and 2 children, around 2.9%

# **EDA** Results – Univariate Analysis: 7. Number of week nights

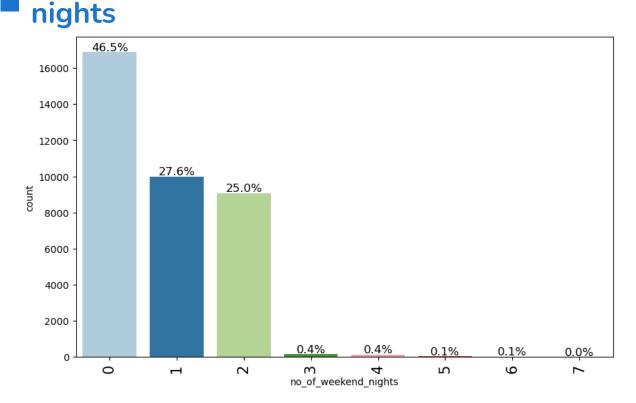

- Top night for holiday: 2 nights, followed with 1 night only
- Maximum night customer book the hotel: 7 nights

## EDA Results – Univariate Analysis: 8. Number of weekend

 Estimated around 46.5% of customer book the hotel not on weekend nights, while 27.6% on 1 night and 25% only on 2 nights

### EDA Results – Univariate Analysis: 9. Required car parking

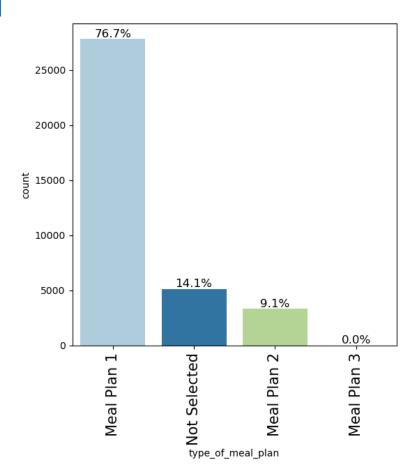

#### space

 Majority of customer (around 96.9%) did not require parking space when they book the hotel, probably coming by using public transport, while only 3.1% require car parking space at the hotel.

### EDA Results - Univariate Analysis: 10. Type of meal plan

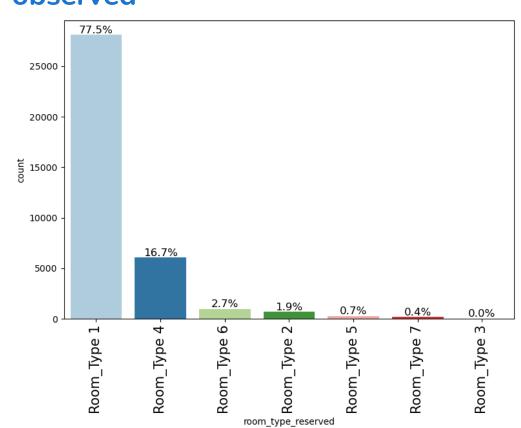

- Majority customer, estimated 76.7% book meal plan 1, which is breakfast meal, probably due to personal activities during daytime or checking out the hotel.
- Other 14.1% did not select any breakfast/meal plan, only 9.1% book meal plan 2.

## EDA Results – Univariate Analysis: 11. Type of room observed

 Majority customer around 77.5% prefers room type 1, followed by room type 4 (16.7%) and other small contributions are coming from room type 6, type 2, type 5 and 7.

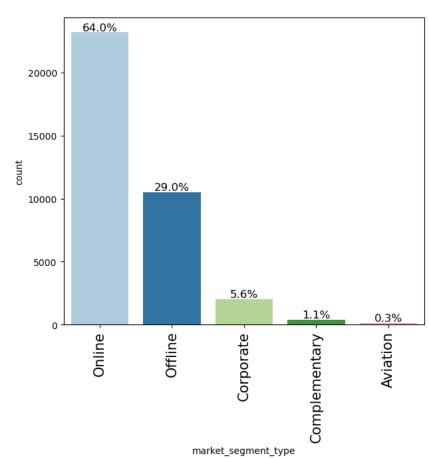

### EDA Results - Univariate Analysis: 12. Arrival month

- The arrival month during hotel booking is vary. The highest contribution is from October (14/7%), followed by September (12.7%), August (10.5%) and June (8.8%). All the months is known for long summer holiday
- End year holiday is followed closely by December and November month, respectively contribute about 8.3% and 8.2%.

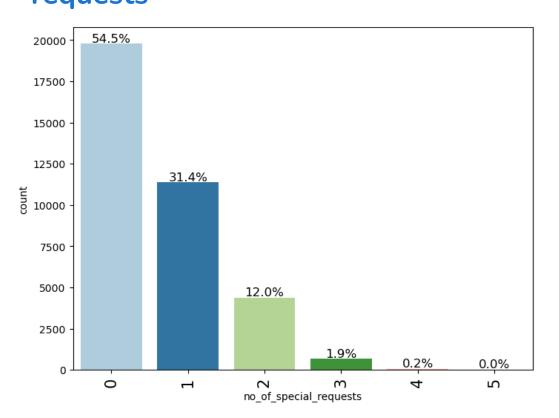

### EDA Results – Univariate Analysis: 13. Market segment type Learning

- Online booking become the highest contribution, estimated around 64.0% and offline estimated around 29.0%.
- This may be due to customer has made the holiday plan ahead and book the hotel early.

# EDA Results – Univariate Analysis: 14. Number of special requests

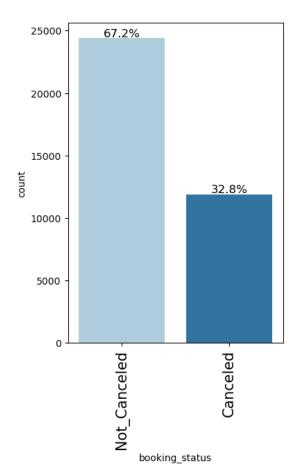

- Half percentage of customer, estimated around 54.5% did not have any special request during their booking, while there is 31.4% of 1 special request from customer to the booked hotel.
- The maximum request made by customer is only 3 request, which contribute to 1.9%.

### **EDA Results – Univariate Analysis: 15. Booking status**

 Estimated 67.2% customer did not cancelled their hotel booking, while 32.8% has made cancellation for the book.

- 0.75 - 0.50 - 0.25 - 0.00 - -0.25 - -0.50 - -0.75
- Most of the parameter is having low to moderate relationship.
- However, moderate relationship is noticed is on repeated\_guest, no\_of\_previous\_cancellations and no\_of\_previous\_bookings\_not\_can celed

# EDA Results – Bivariate Analysis: 1. Prices vary across different market segment

- Outlier price was noticed on offline, online, corporate and complementary segment.
- Corporate and complementary segment is having right skewed.

# EDA Results – Bivariate Analysis: 2. Average price per rook impacts booking status

 All booking segment is not affected by price per room, especially on complementary segment. The customer book the hotel mostly looking into other things besides room price.

booking_status market_segment_type	0	1	All
All	24390	11885	36275
Online	14739	8475	23214
Offline	7375	3153	10528
Corporate	1797	220	2017
Aviation	88	37	125
Complementary	391	0	391

### **EDA Results – Bivariate Analysis: 3. Impact cancellations**

 No impact on booking cancellations were observed, as long as customer requests are being fulfilled.

booking_status no_of_special_requests	0	1	Al
All	24390	11885	3627
0	11232	8545	
1	8670	2703	1137
2	3727	637	436
3	675	0	67
4	78	0	7
5	8	a	

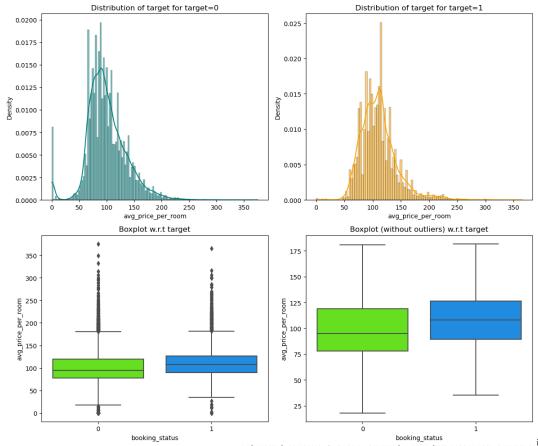

# EDA Results – Bivariate Analysis: 4. Customers impacts the prices of a room

 All requests are observed having quite comparable average price per room, despite all of the data is right skewed.

# EDA Results – Bivariate Analysis: 5. Positive correlation between booking status and average price per room

 Both booking status are having normal distribution (normal bell-curved) even after outlier removed. Both booking status is having comparable average price per room.

# EDA Results – Bivariate Analysis: 6. Positive correlation between booking status and lead time

 Both booking type (cancelled and not cancelled having some outliers, and after outlier removed, found cancelled booking status is having wider range compared with customer not cancelling their booking.

### EDA Results – Bivariate Analysis: 7. Travelling with famili Great Learning

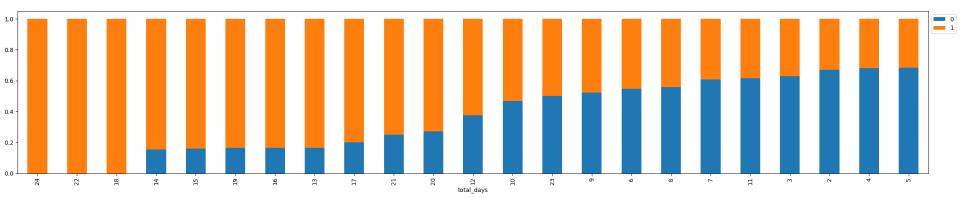

All family members regardless the family quantity did not affect any booking status.

## EDA Results – Bivariate Analysis: 8. Stay at least one day G

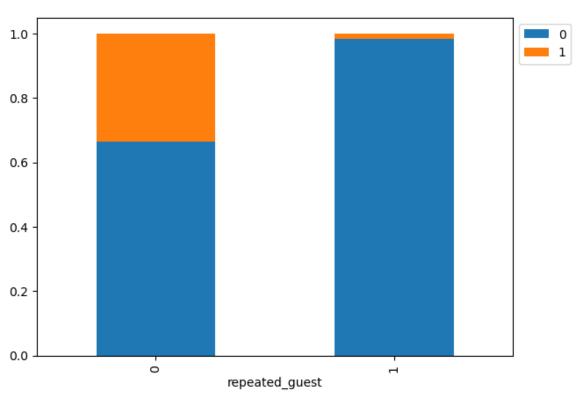

- The most customer is booked and stay at the hotel is 24days, while the minimum days is 5.
- Most customer is spending a long holiday at the hotel.

# EDA Results – Bivariate Analysis: 9. Repeated guests cancel booking

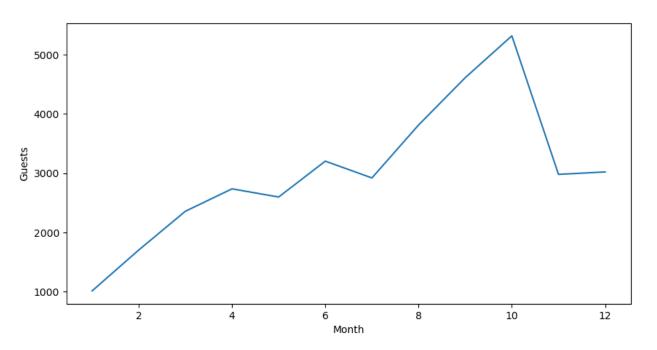

• Less customer was observed to cancelled their hotel booking.

## EDA Results – Bivariate Analysis: 10. The busiest month in the hotel

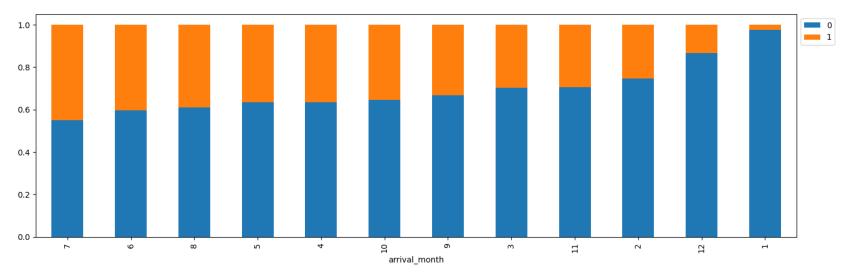

- The busiest month was observed during summer holiday, with the peak month is at October.
- End holiday is observed to pick up the similar trend with Jun-July guests.

## EDA Results – Bivariate Analysis: 11. Bookings cancelled

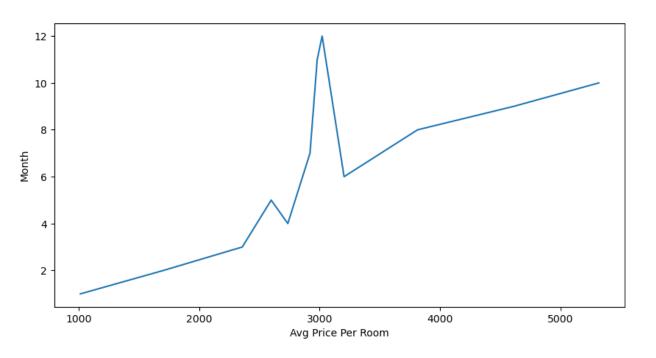

#### in each month

- The highest quantity bookings were cancelled are from summer holiday (top 3 detractor is from July, June and Aug)
- The lowest was seen on Dec and Jan.

# EDA Results – Bivariate Analysis: 12. Hotel room prices vary across different months

 End holiday is at the peak with average price 3000 euros and 5000 euros.

### **Data Preprocessing – 1. Outlier Check**

3.0 2.5 2.0 10.0 1.5 7.5 1.0 0.5 2.5 0.0 0.0 required car parking space lead time arrival month arrival year 2018.0 400 2017.8 300 2017.6 200 2017.4 100 2017.2 arrival date repeated guest no of previous cancellations no of previous bookings not canceled 0.8 10 0.6 0.4 20 -0.2 10 avg\_price\_per\_room no of special requests

 Few outliers found, but we are not going to remove the data, as we need this outlier data for our modelling later

Training Performance

	Accuracy	Recall	Precision	F1
0	0.80498	0.63028	0.73917	0.68039

- All data is comparable and not affected after removing high VIF value.
- Next, we will proceed to remove high Pvalue.

### Data Preprocessing – 6. Dropping high P-value

- High P-value after dropping, as below:
  - 'const', 'no\_of\_adults', 'no\_of\_children', 'no\_of\_weekend\_nights', 'no\_of\_week\_nights', 'required\_car\_parking\_space', 'lead\_time', 'arrival\_year', 'arrival\_month', 'repeated\_guest', 'no\_of\_previous\_cancellations', 'avg\_price\_per\_room', 'no\_of\_special\_requests', 'type\_of\_meal\_plan\_Meal Plan 2', 'type\_of\_meal\_plan\_Not Selected', 'room\_type\_reserved\_Room\_Type 2', 'room\_type\_reserved\_Room\_Type 4', 'room\_type\_reserved\_Room\_Type 5', 'room\_type\_reserved\_Room\_Type 6', 'room\_type\_reserved\_Room\_Type 7', 'market\_segment\_type\_Corporate', 'market\_segment\_type\_Offline'

## Data Preprocessing – 7. Re-check Modeling and its performance

#### Model result

Training Performance

	Accuracy	Recall	Precision	F1
0	0.80545	0.63267	0.73907	0.68174

Test Performance

	Accuracy	Recall	Precision	F1
0	0.80594	0.62834	0.73375	0.67697

- All data is comparable and not affected after removing high P-value.
- The performance for both training and test is comparable, and it seems the data is not overfitting.

### **Data Preprocessing – 8. Converting coefficients to odds**

#### After conversion

# Data Preprocessing – 9. Checking performance on the training set

Confusion matrix

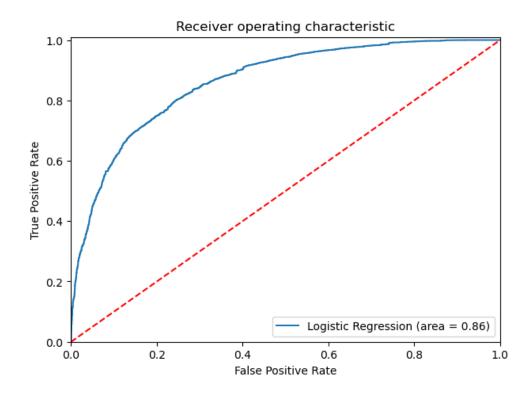

Training Performance

	Accuracy	Recall	Precision	F1
0	0.80281	0.62143	0.73842	0.67489

 All data is still comparable from previous performance after conversion.

### Model Performance Evaluation and Improvement – 1. Checking ROC-A Great Learning on the training set

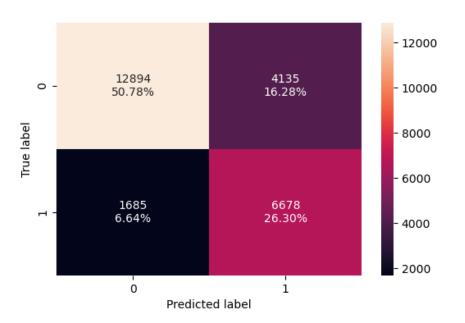

Based on ROC-AUC curve, the model is performing well on the training set.

## Model Performance Evaluation and Improvement – 2. Optimize threshold Learnin using ROC-AUC curve

- Optimal threshold is on value 0.2993111390299003
- Therefore, the confusion matrix as below:

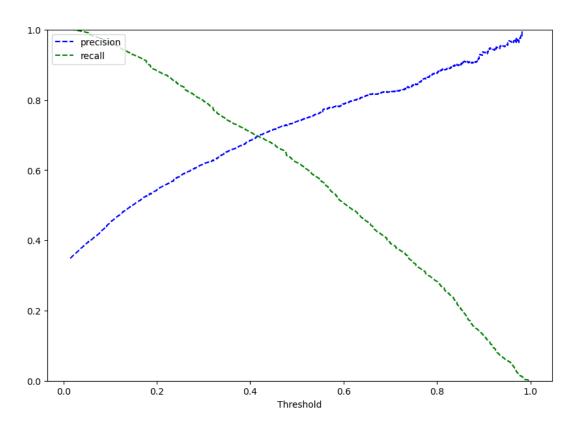

#### Training Performance

	Accuracy	Recall	Precision	F1
0	0.77079	0.79852	0.61759	0.69650

- After we set the optimal threshold value, we observed the training performance slightly decrease from previous performance.
- However, we will check the precisionrecall curve first before performing any assumption/summary.

### Model Performance Evaluation and Improvement – 2. Checking the Precision-Recall Curve

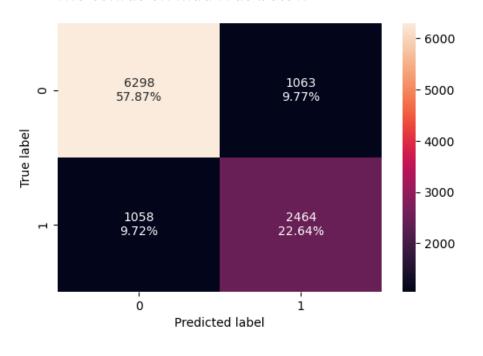

• A threshold around 0.42, we may get a balanced precision and recall.

### Model Performance Evaluation and Improvement – 3. Checking model performance on the test set

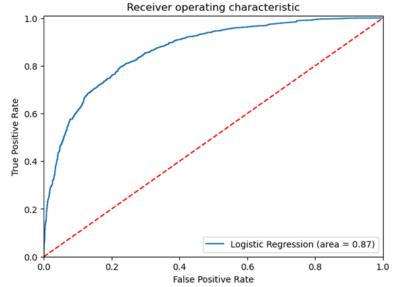

- First optimal threshold was set at default.
- The confusion matrix as below:

#### Training Performance

	Accuracy	Recall	Precision	F1
0	0.80511	0.69960	0.69861	0.69911

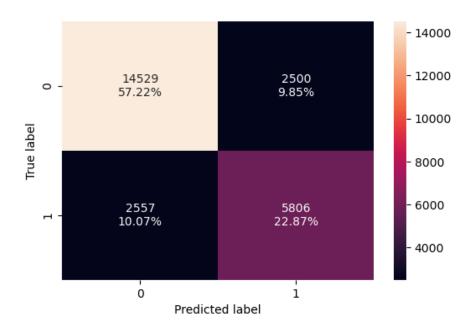

#### ROC Curve

### Model Performance Evaluation and Improvement – 4. Checking model performance on the training set

- Second optimal threshold was set at: 0.42
- The confusion matrix as below:

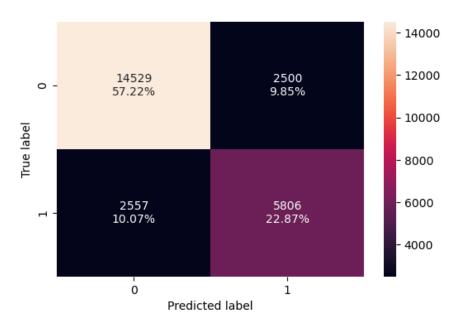

#### Training Performance

	Accuracy	Recall	Precision	F1
0	0.80084	0.69425	0.69901	0.69662

### Model Performance Evaluation and Improvement – 5. Checking model performance on the test set

- Testing the test set with optimal threshold was set at: 0.42
- The confusion matrix as below:

#### Test Performance

	Accuracy	Recall	Precision	F1
0	0.80084	0.69425	0.69901	0.69662

### Model Performance Evaluation and Improvement – 6. Checking model performance on the test set

Testing the test set with optimal threshold was set at: 0.37

The confusion matrix as below:

#### Test Performance

	Accuracy	Recall	Precision	F1
0	0.79390	0.73311	0.66461	0.69718

# Model Performance Summary – 7. Training Performance Comparison

	Logistic Regression- default Threshold	Logistic Regression- 0.37 Threshold	Logistic Regression- 0.42 Threshold
Accuracy	0.80281	0.77079	0.80084
Recall	0.62143	0.79852	0.69425
Precision	0.73842	0.61759	0.69901
F1	0.67489	0.69650	0.69662

- All three thresholds are giving the reliable and good performance without overfitting.
- However, among the three performance, the 0.42 threshold is giving the best value of F1. Therefore, it will be selected as the final model.
- All three thresholds will be tested on the test data.

## Model Performance Summary – 8. Checking the Test Performance

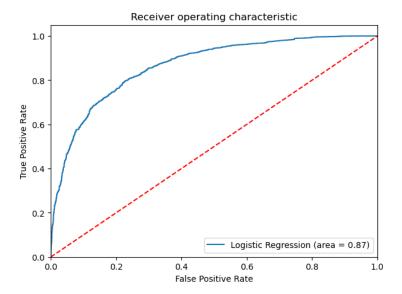

- First optimal threshold was set at default.
- The confusion matrix as below:

#### Test Performance

	Accuracy	Recall	Precision	F1
0	0.80594	0.62834	0.73375	0.67697

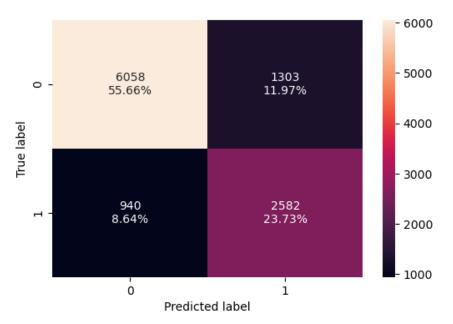

#### ROC Curve

## Model Performance Summary – 9. Checking the Test Performance

- Testing with optimal threshold was set at: 0.37
- The confusion matrix as below:

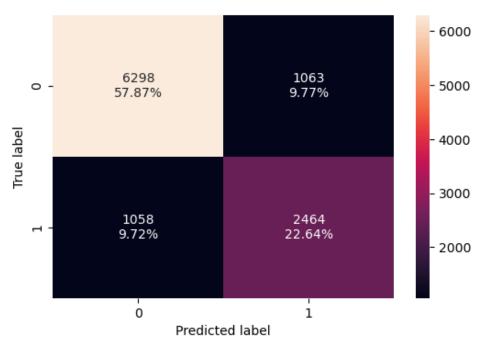

Test Performance

	Accuracy	Recall	Precision	F1
0	0.79390	0.73311	0.66461	0.69718

## Model Performance Summary – 10. Checking the Test Performance

- Testing with optimal threshold was set at: 0.42
- The confusion matrix as below:

#### Test Performance

	Accuracy	Recall	Precision	F1
0	0.80511	0.69960	0.69861	0.69911

## Model Performance Summary – 7. Test Performance Comparison

	Logistic Regression- default Threshold	Logistic Regression- 0.37 Threshold	Logistic Regression- 0.42 Threshold
Accuracy	0.80594	0.79390	0.80511
Recall	0.62834	0.73311	0.69960
Precision	0.73375	0.66461	0.69861
F1	0.67697	0.69718	0.69911

- All three thresholds are giving the reliable and good performance without overfitting on a test data.
- As predicted on the training performance data, threshold 0.42 is giving the best F1 result. It also can be seen above on the test data by giving the best F1 value compared on default and 0.37 threshold.
- Therefore, we will take threshold 0.42 as the best threshold.

# Data Preparation for Decision Tree – 1. Encode Categorical Value

### Data Preparation for Decision Tree – 2. Split data

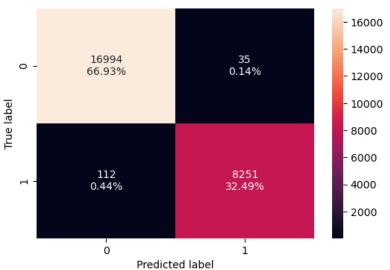

Split data into 70:30

```
Shape of Training set: (25392, 27)
Shape of test set: (10883, 27)
Percentage of classes in training set:
0 0.67064
1 0.32936
Name: booking_status, dtype: float64
Percentage of classes in test set:
0 0.67638
1 0.32362
Name: booking_status, dtype: float64
```

### Data Preparation for Decision Tree – 3. Building Decision Telegraphing and Model Performance Check

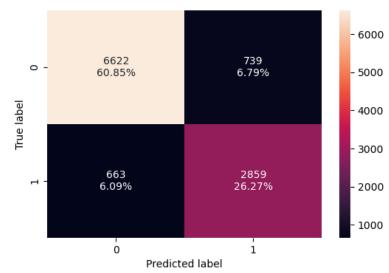

Training Performance

	Accuracy	Recall	Precision	F1
0	0.99421	0.98661	0.99578	0.99117

**Test Performance** 

	Accuracy	Recall	Precision	F1
0	0.87118	0.81175	0.79461	0.80309

- Training and test performance is far different from each other, an indication of overfitting.
- Pre-pruning is necessary.

## Data Preparation for Decision Tree – 4. Check Important Features

- Among importance feature is lead\_time, avg\_price\_per\_room and market\_segment\_type\_online (top 3)
- The parameter need to observe again after pre-pruning.

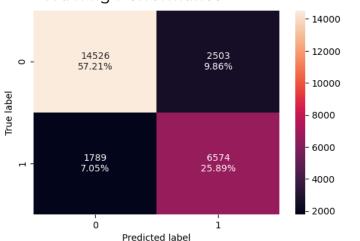

### Data Preparation for Decision Tree – 5. Pre-pruning

Pre-pruning

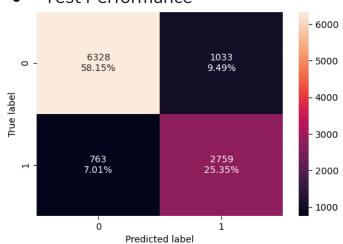

DecisionTreeClassifier(class\_weight='balanced', max\_depth=6, max\_leaf\_nodes=50, min samples split=10, random state=1)

Training Performance

	Accuracy	Recall	Precision	F1
0	0.83097	0.78608	0.72425	0.75390

#### Test Performance

	Accuracy	Recall	Precision	F1
0	0.83497	0.78336	0.72758	0.75444

The performance for both training and test is now comparable after pre-pruning.

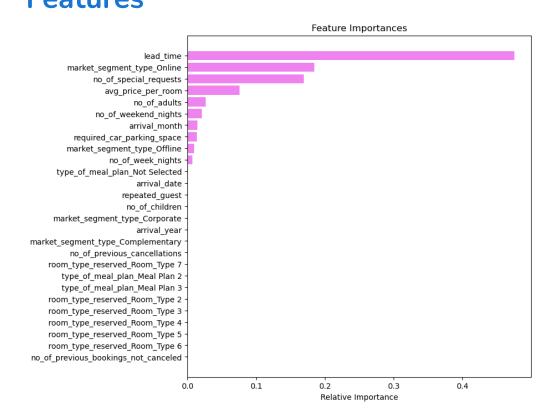

## Data Preparation for Decision Tree – 6. Visualising the Decision Tree

## Data Preparation for Decision Tree – 7. Re-check Important

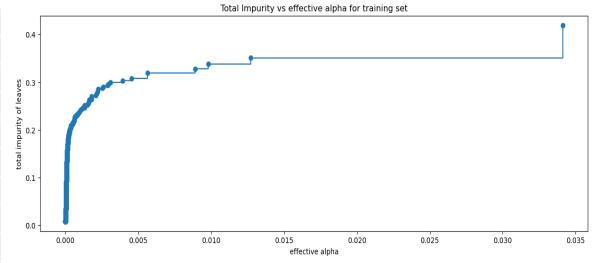

- After pre-pruning, some important features has changed.
- Now the top three after prepruning is lead\_time, market\_segment\_type\_online and no\_of\_special\_request.

# Data Preparation for Decision Tree – 8. Cost Complexity Pruning

Number of nodes in the last tree is: 1 with ccp\_alpha: 0.0811791438913696

### Data Preparation for Decision Tree – 10. F1 Score for alpha

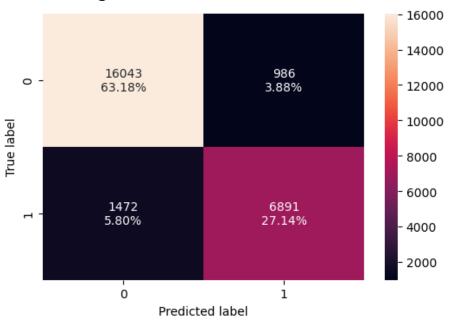

- Best model: decision tree classifier (ccp\_alpha=0.00011676062470523539, random\_state=1)
- Both value is comparable.

## Data Preparation for Decision Tree – 11. Model Performance Check

Great Learning

### Model Building – 12. Decision Tree

### Model Building – 14. Important Features

- Some important features change again post pruning
- Now the top three after prepruning is lead\_time, avg\_price\_per\_room and market\_segment\_type\_online

### Model Building – 15. Final Model Performance Check

#### Training Performance

	Decision Tree sklearn	Decision Tree (Pre-Pruning)	Decision Tree (Post-Pruning)
Accuracy	0.99421	0.83097	0.90320
Recall	0.98661	0.78608	0.82399
Precision	0.99578	0.72425	0.87483
F1	0.99117	0.75390	0.84865

#### • Test Performance

	Decision Tree sklearn	Decision Tree (Pre-Pruning)	Decision Tree (Post-Pruning)
Accuracy	0.87118	0.83497	0.88275
Recall	0.81175	0.78336	0.79046
Precision	0.79461	0.72758	0.83805
F1	0.80309	0.75444	0.81356

### Model Performance Evaluation and Improvement - Decision Tree

- Decision tree before pre-pruning giving the best training performance but the difference on the test performance is high, an indication of overfitting.
- Decision tree post pruning is giving us the best F1 score and both training and test performance is comparable, an indication of data is not overfitting.
- It is giving us the prediction of 79% of why the hotel bookings are being cancelled, based on the listed reasons on the importance features.
- We conclude that lead\_time, avg\_price\_per\_room, market\_segment\_type\_online and no\_of\_special\_request is the most top 4 importance features when we predict why the significant number of hotel bookings are being called off/cancelled.
- The company should focus to improve on those 4 features to prevent for another cancellations by customers in the near future.

### **APPENDIX**

### **Data Background and Contents**

- Data.shape() 36275 columns, 19 rows
- No duplicated data found.
- No missing data found.
